Clinical Policy: Plasmapheresis, Plasma Exchange, Therapeutic Apheresis
Reference Number: CP.MP.HN322
Effective Date: 8/16
Last Review Date: 8/17

See Important Reminder at the end of this policy for important regulatory and legal information.

Description
This policy describes the medical necessity guidelines for plasmapheresis based on the guidelines from the American Society for Apheresis. In this procedure, whole blood is removed from the body, its cellular elements are separated from the plasma by centrifugation or filtration, and the cells suspended in saline or some other plasma substitute are reinfused. This depletes the body's own plasma without depleting its cells.

Policy/Criteria
I. It is the policy of Health Net of California that plasmapheresis, plasma exchange and therapeutic apheresis are medically necessary for any of the following indications:
   A. ABO incompatible bone marrow transplants;
   B. ABO incompatible solid organ transplant [i.e., Kidney, Heart (< 40 months of age)];
   C. Acute disseminated encephalomyelitis where conventional treatment has failed;
   D. ANCA-associated rapidly progressive glomerulonephritis (Wegener’s Granulomatosis);
   E. Catastrophic antiphospholipid antibody syndrome (Hughes Syndrome) unresponsive to conventional therapy (aspirin, warfarin, heparin);
   F. Chronic inflammatory demyelinating polyneuropathy, also known as chronic relapsing polyneuropathy, is documented by symmetric or focal neurological deficits with slowly progressive or relapsing course > 2 months with characteristic neurophysiologic abnormalities, for individuals with all of the following:
      1. Associated with severe or life-threatening symptoms or severe disability; and
      2. Diagnosed by slowing of nerve conduction velocity on EMG/NCS and elevated spinal fluid protein on lumbar puncture; and
      3. Failure to respond to conventional treatment with prednisone and intravenous immunoglobulins (IVIG);
   G. Chronic demyelinating gammopathy;
   H. Chronic focal encephalitis (Rassmussen’s Encephalitis);
   I. Cold Agglutinin disease (life threatening due to fulminant hemolysis);
   J. Symptomatic thrombocytosis, or when platelet count is ≥ 1,000,000/cu.mm (cytapheresis);
   K. Guillain-Barré syndrome, for severely ill patients who are diagnosed with grade 3-5 disease, which includes the ability to walk 5 meters with assistance, confinement to a bed or chair-bound, or requiring assisted ventilation for at least part of the day or night
   L. Multiple Sclerosis (i.e., Acute CNS inflammatory demyelinating disease unresponsive to steroids)
   M. Myasthenia gravis in acute crisis because of a sudden worsening of symptoms, as in an impending respiratory crisis, which fails to respond to all other treatments (e.g.,
Plasmapheresis

cholinesterase inhibitors, corticosteroids, immunosuppressant drugs, IVIG, and/or thymectomy) or needs rapid improvement of strength before surgery or irradiation

N. Hemolysis, elevated liver enzymes, and low platelet count (HELLP) syndrome of pregnancy in women who are not getting better within 5 days > delivery

O. Hyperglobulinemias, including (but not limited to) multiple myelomas, severe/symptomatic cryoglobulinemia, primary (Waldenstrom's) macroglobulinemia, and hyperviscosity syndromes

P. Idiopathic Thrombocytopenic Purpura in emergency situations

Q. IgA and IgG paraproteinemias with polyneuropathy

R. Lambert-Eaton myasthenia syndrome

S. Leukemia (Leukapheresis) (for acute debulking only)

T. Mushroom poisoning

U. Myeloma kidney (acute renal failure secondary to multiple myeloma)

V. Neuromyelitis optica (Devic’s syndrome)

W. Pediatric autoimmune neuropsychiatric disorders associated with streptococcal infections (exacerbation) and Sydenham's Chorea when symptoms are severe and other therapies have failed to reduce symptom severity

X. Phytanic Acid Storage Disease when used to rapidly lower plasmic phytanic acid levels during acute attacks (Refsum's disease)

Y. Post renal transplant recurrent focal and segmental glomerulosclerosis (FGS) or acute humoral rejection

Z. Progressive renal failure due to antiglomerular basement membrane antibodies and pulmonary hemorrhage (Goodpasture's syndrome) (i.e., dialysis independent; Diffuse alveolar hemorrhage) (plasma perfusion of charcoal filters)

AA. Pure red cell aplasia unresponsive to steroid and immunosuppressive therapy

BB. Red cell alloimmunization in pregnancy until intrauterine transfusion can safely be administered

CC. Renal transplantation from live donor with ABO incompatibility or positive cross-match, where a suitable non-reactive live or cadaveric donor is unavailable

DD. Renal transplantation in highly sensitive kidney transplant candidates (high PRA protocols) to reduce the number of antibodies reactive against human lymphocyte antigens

EE. Severe bullous pemphigoid

FF. Severe hypercholesterolemia in person's refractory to diet and maximum drug therapy who are homozygous for familial hypercholesterolemia (LDL apheresis, also known as heparin-induced extracorporeal LDL precipitation or dextra sulfate adsorption) with LDL levels greater than 500 mg/dL, or persons heterozygous for familial hypercholesterolemia with LDL levels > 300 mg/dL or > 200 mg/dL with documented history of coronary artery disease

GG. Sickle cell disease (therapeutic cytopheresis)

HH. Solid organ transplant: prior to transplant as a treatment for patients at high-risk of antibody mediated rejection or following transplant as a treatment of antibody mediated rejection

II. Systemic lupus erythematosus, severe, for refractory or critically ill patients (e.g., cerebritis, diffuse alveolar hemorrhage)
Plasmapheresis

JJ. Systemic vasculitis (life threatening rheumatoid, polyarteritis nodosa, Wegener’s granulomatosis, microscopic vasculitis) unresponsive to conventional therapy (e.g., high-dose cortico-steroids, immunosuppressants, particularly cyclophosphamide [Cytoxan], azathioprine [Imuran] or methotrexate [Rheumatrex])

KK. Thrombotic microangiopathy: drug associated (i.e., Ticlopedine/Clopido
grel)

LL. Thrombotic thrombocytopenic purpura /Hemolytic Uremic Syndrome or microangiopathic hemolytic

MM. Paraproteinemic polyneuropathy (except for asymptomatic monoclonal gammopathy of unknown significance)

NN. Wilson’s disease, fulminant hepatic failure with hemolysis (bridge to liver transplant)

OO. Pemphigus vulgaris that is resistant to standard therapy (e.g. dapsone, corticosteroids, immunosuppressants such as azathioprine or cyclosporine)

PP. Babesiosis, with a high grade parasitemia, severe anemia or hepatic, pulmonary, or renal compromise (red blood cell exchange);

QQ. Recurrence of focal and segmental glomerulosclerosis in the kidney allograft

RR. Treatment of transverse myelitis when corticosteroid treatment has failed.

II. It is the policy of Health Net of California that plasmapheresis, plasma exchange, and therapeutic apheresis are medically necessary on a case by case basis for use in the treatment of any of the following:

A. ABO incompatible liver transplantation, perioperative
B. Acute liver failure
C. AIDS
D. ANCA-associated rapidly progressive glomerulonephritis (i.e., dialysis independent)
E. Aplastic anemia
F. Cardiac allograft rejection (treatment of antibody mediated rejection)
G. Chronic progressive or relapsing-remitting muscular sclerosis in absence of acute fulminant onset
H. Dilated cardiomyopathy NYHA II-IV
I. Acute pancreatitis related to hyperlipidemia to lower markedly elevated triglyceridelevels acutely in patients with associated severe pancreatitis (i.e., hypertriglyceridemic pancreatitis)
J. Immune complex rapidly progressive glomerulonephritis
K. LAK cells for reinfusion with Interleukin II
L. Multiple myeloma
M. Nephrogenic systemic fibrosis
N. Overdose, venoms and poisoning (invenomation, monoclonal antibody with PML, other compounds)
O. Paraneoplastic neurological syndromes
P. Post transfusion purpura
Q. Renal transplantation (i.e., high PRA; cadaveric donor)
R. Scleroderma (progressive systemic sclerosis)
S. Sepsis with multi-organ failure
T. Thyroid storm
Plasmapheresis

U. Treatment of antibody mediated rejection
V. Thrombotic microangiopathy: drug associated, (i.e. Cyclosporine/Tacrolimus,
W. Thrombotic microangiopathy: hematopoietic stem cell transplant–associated
X. Warm autoimmune hemolytic anemia

III. It is the policy of Health Net of California that plasmapheresis, plasma exchange and therapeutic apheresis are not medically necessary for any of the following indications because there is inadequate scientific evidence in the medical literature validating their effectiveness:
A. Amyloidosis, systemic
B. Amyotrophic lateral sclerosis
C. Asthma
D. Burn shock resuscitation
E. Chronic fatigue syndrome
F. Coagulation factor inhibitors
G. Diarrhea-Associated Pediatric Hemolytic Uremic Syndrome or typical HUS
H. Guillain-Barré syndrome, grades 1-2
I. Hashimoto's encephalopathy
J. Immune thrombocytopenic purpura
K. Inclusion body myositis
L. Lupus Nephritis
M. Multifocal motor neuropathy
N. Necrobiotic xanogranulomatous skin disorder
O. Parkinson's disease
P. POEMS syndrome (polyneuropathy, organomegaly, endocrinopathy, M protein and skin changes)
Q. Polymyositis and dermatomyositis unless unresponsive to conventional therapy
R. Psoriasis
S. Pulmonary alveolar proteinosis
T. Rapidly progressive glomerulonephritis, excluding those related to anti-basement membrane immunoglobulins (e.g., Goodpasture’s syndrome)
U. Raynaud's phenomenon
V. Regional enteritis (Crohn's disease)
W. Refractory rheumatoid arthritis
X. Rheumatoid arthritis except for life-threatening vasculitis
Y. Schizophrenia
Z. Stiff man syndrome
AA. Thrombotic microangiopathy: drug associated (i.e., Gemcitabine and Quinine)
BB. Alzheimer’s Disease
CC. High density lipoprotein (HDL) delipidation and plasma re-infusion for acute coronary syndrome

Background
The terms therapeutic apheresis, plasmapheresis and plasma exchange are often used interchangeably, but actually refer to different procedures.
Apheresis is an extracorporeal medical technology in which the blood of a patient is passed through an apparatus that separates out one particular constituent and returns the remainder to the circulation. Leukapheresis or lymphocytapheresis also describes apheresis procedures in which the white blood cells are isolated and retained. As another example, peripheral stem cell collection, done in preparation for autologous bone marrow transplant, involves an apheresis procedure in which the critical stem cells are isolated and retained.

Plasmapheresis is generally performed to remove and discard harmful substances (e.g., toxins or autoantibodies), which have accumulated in the plasma. It is hypothesized that removal of these factors can be therapeutic in certain situations.

Plasma exchange (PE) is a procedure in which the plasma is separated from the blood, discarded in total, and replaced with a substitution fluid such as albumin or with donated plasma from a healthy person. This also is generally performed to remove toxins or autoantibodies that have accumulated in the plasma. Rapidly reducing specific autoantibodies may sometimes lead to a rebound overproduction of the same antibodies. This rebound production of antibodies is thought to make the replicating pathogenic cells more vulnerable to cytotoxic drugs. For this reason, it is often performed to enhance the effectiveness of cytotoxic drugs (e.g., cyclophosphamide). The number of treatments needed varies greatly depending on the particular disease and the person's general condition. Plasma exchange is essentially a symptomatic therapy, since it does not remove the source of the pathogenic factors. Therefore, the success of PE will depend on whether the pathogenic substances are accessible through the circulation, and whether their rate of production and transfer to the plasma component can be adequately addressed by PE. An average course of plasma exchanges is six to 10 treatments over two to 10 weeks.

Applications of plasma exchange can be subdivided into 2 general categories: 1) acute self-limited diseases in which apheresis are used to acutely lower the circulating pathogenic substance; and 2) chronic diseases, in which there is ongoing production of pathogenic autoantibodies. The applications of plasma exchange seen in acute self-limited conditions are many. Serum hyper viscosity is most commonly related to overproduction of immuno-globulins and thus is seen in association with B-cell lymphocyte neoplasm’s such as multiple myeloma and Waldenström's macroglobulinemia, a cancer of the B lymphocytes that causes overproduction of monoclonal macroglobulin (IBM antibody). This hyperviscosity interferes with blood flow through small blood vessels, which leads to many of the symptoms of the disease. Symptoms of hyperviscosity include bleeding disorders, retinopathy, and neurologic disorders, including stroke. Treatment is principally directed at the underlying disorder, but PE may be used to acutely lower the serum viscosity by removing or reducing the high concentration of IgM.

Severe hypertriglyceridemia with an accumulation of chylomicrons and triglyceride figures >1000 mg/dL can cause acute pancreatitis, a potentially fatal complication. When standard therapies fail to achieve favorable clinical and metabolic outcomes, selected patients with HTG-induced pancreatitis may be referred for plasmapheresis, or plasma exchange (PE), to remove serum lipids, primarily triglycerides. Studies done by Ramirez-Bueno et al. (2015) Gubensek et al. (2014), and Stafanuti et al. (2011), have been done to determine the efficacy of this
Plasmapheresis procedure, however there is a lack of long-term outcomes. The peer-reviewed literature, confirms the need for randomized clinical trials to compare conventional treatment versus plasmapheresis in patients with severe hypertriglyceridemic pancreatitis.

Because plasmapheresis does not address underlying pathology, and due to the phenomenon of rebound antibody production, its use in chronic diseases has been more controversial than in acute self-limited diseases. However, based on the peer-reviewed literature, plasmapheresis is a widely accepted component in the management of acute rejection, with most experience related to kidney trans-plantation due to its higher volume and use in living donors. It is accepted as standard therapy for transplant recipients at high risk for antibody mediated rejection (AMR). As a treatment of AMR, plasmapheresis is often used in combination with IVIG or anti-CD20 therapy.

American Gastroenterological Association (AGA)
The AGA published a medical position statement on acute pancreatitis to guide clinicians in the management of patients with both mild and severe forms of acute pancreatitis. However, the guidelines do not refer to apheresis or plasmapheresis as possible treatment options for acute pancreatitis.

American Society for Apheresis (ASFA)
The ASFA recommends the following Category I indications for therapeutic plasma exchange:

American Academy of Neurology (AAN)
Plasmapheresis

The AAN completed an evidence-based guideline update from the Therapeutics and Technology Assessment Subcommittee regarding plasmapheresis in neurologic disorders made the following recommendations:

1. Plasmapheresis should be offered in the treatment of acute inflammatory demyelinating polyneuropathy/Guillain-Barre’ syndrome (AIDP/GBS) severe enough to impair independent walking or to require mechanical ventilation (Level A). Plasmapheresis should be considered in the treatment of milder clinical presentations of AIDP/GBS (Level B). The guideline notes that IV immunoglobulin (IVIg) is an alternative treatment used in patients with AIDP/GBS. There is insufficient evidence to demonstrate the superiority of one treatment over the other.

2. Plasmapheresis should be offered as a short-term treatment for patients with chronic inflammatory demyelinating neuropathy (CIDP). (Level A). The guideline notes that steroids, IVIg, and immunosuppressants have also been used in the treatment of CIDP.

3. Plasmapheresis should be considered in polyneuropathy associated with IgA and IgG monoclonal gammopathy of undetermined Significance (MGUS) (Level B).

4. Plasmapheresis should not be considered in the treatment of polyneuropathy associated with IgM MGUS (Level B).

5. Because of the lack of randomized controlled studies with masked outcomes, there is insufficient evidence to support or refute the efficacy of plasmapheresis in the treatment of myasthenic crisis (Level U) or myasthenia gravis (MG) prethymectomy (Level U). The guideline notes that despite the fact that the use of plasmapheresis in myasthenic crisis and MG prethymectomy receives a Level U recommendation, plasmapheresis is used at many medical centers for these indications.

6. Plasmapheresis should be considered for the adjunctive treatment of exacerbations in relapsing forms of MS (Level B). Plasmapheresis may be considered in the treatment of fulminant CNS demyelinating diseases that fail to respond to high-dose corticosteroid treatment (Level C). Plasmapheresis should not be offered for chronic progressive or secondary progressive MS (Level A). The guideline states that no studies on the efficacy of plasmapheresis compared to other treatment options in MS are available.

7. There is insufficient evidence to support or refute the use of plasmapheresis in the treatment of acute obsessive compulsive disorder (OCD) and tic symptoms in the setting of PANDAS (Level U).

8. There is insufficient evidence to support or refute the use of plasmapheresis in the treatment of Sydenham chorea (Level U).

American Association for the Study of Liver Diseases (AASLD)
The AASLD recommends: treatment for Wilson's Disease to acutely lower serum copper and to limit further hemolysis should include albumin dialysis, continuous hemofiltration, plasmapheresis, or plasma exchange.  

American Society of Hematology
American Society of Hematology recommends the use of plasma exchange in HELLP syndrome if thrombocytopenia, hemolysis, or renal failure continues to worsen 48 to 72 hours postpartum.

American Family Physician (AMF)
The AMF notes that the use of plasma exchange with Guillain-Barré Syndrome has been shown to improve short-term and long-term outcomes.

Coding Implications
This clinical policy references Current Procedural Terminology (CPT®). CPT® is a registered trademark of the American Medical Association. Important Reminder
Plasmapheresis
This clinical policy has been developed by appropriately experienced and licensed health care professionals based on a review and consideration of currently available generally accepted standards of medical practice; peer-reviewed medical literature; government agency/program approval status; evidence-based guidelines and positions of leading national health professional organizations; views of physicians practicing in relevant clinical areas affected by this clinical policy; and other available clinical information. The Health Plan makes no representations and accepts no liability with respect to the content of any external information used or relied upon in developing this clinical policy. This clinical policy is consistent with standards of medical practice current at the time that this clinical policy was approved. “Health Plan” means a health plan that has adopted this clinical policy and that is operated or administered, in whole or in part, by Centene Management Company, LLC, or any of such health plan’s affiliates, as applicable.

The purpose of this clinical policy is to provide a guide to medical necessity, which is a component of the guidelines used to assist in making coverage decisions and administering benefits. It does not constitute a contract or guarantee regarding payment or results. Coverage decisions and the administration of benefits are subject to all terms, conditions, exclusions and limitations of the coverage documents (e.g., evidence of coverage, certificate of coverage, policy, contract of insurance, etc.), as well as to state and federal requirements and applicable Health Plan-level administrative policies and procedures.

This clinical policy is effective as of the date determined by the Health Plan. The date of posting may not be the effective date of this clinical policy. This clinical policy may be subject to applicable legal and regulatory requirements relating to provider notification. If there is a discrepancy between the effective date of this clinical policy and any applicable legal or regulatory requirement, the requirements of law and regulation shall govern. The Health Plan retains the right to change, amend or withdraw this clinical policy, and additional clinical policies may be developed and adopted as needed, at any time.

This clinical policy does not constitute medical advice, medical treatment or medical care. It is not intended to dictate to providers how to practice medicine. Providers are expected to exercise professional medical judgment in providing the most appropriate care, and are solely responsible for the medical advice and treatment of members. This clinical policy is not intended to recommend treatment for members. Members should consult with their treating physician in connection with diagnosis and treatment decisions.

Providers referred to in this clinical policy are independent contractors who exercise independent judgment and over whom the Health Plan has no control or right of control. Providers are not agents or employees of the Health Plan.

This clinical policy is the property of the Health Plan. Unauthorized copying, use, and distribution of this clinical policy or any information contained herein are strictly prohibited. Providers, members and their representatives are bound to the terms and conditions expressed herein through the terms of their contracts. Where no such contract exists, providers, members and their representatives agree to be bound by such terms and conditions by providing services to members and/or submitting claims for payment for such services.
Plasmapheresis

**Note: For Medicaid members,** when state Medicaid coverage provisions conflict with the coverage provisions in this clinical policy, state Medicaid coverage provisions take precedence. Please refer to the state Medicaid manual for any coverage provisions pertaining to this clinical policy.

**Note: For Medicare members,** to ensure consistency with the Medicare National Coverage Determinations (NCD) and Local Coverage Determinations (LCD), all applicable NCDs and LCDs should be reviewed prior to applying the criteria set forth in this clinical policy. Refer to the CMS website at [http://www.cms.gov](http://www.cms.gov) for additional information.
